

## Task

Create a Current Weather app.

## Description

We need an MVP website on which the user will type a city name and press a button and receive the current weather in an easy to see and understand way. The design is not important at this stage.

We need an input field where the user will enter his city and a button which will then fetch the data.

## Data source

Please use as your weather data source the API from <https://www.weatherapi.com/>. It's free and good enough for our purpose.

## Technology

You are free to use any technology you prefer but I suggest to use Angular (TypeScript).

## Deadline

Deadline of presentation of the MVP is the 30<sup>th</sup> April.
